MG2lab – Multigood microgrid experimental facility

Configuration

- Electric power generation capacity: 100 kW
- Thermal power generation capacity: 45 kW
- Potable water production: 1 m³/h
- PEM electrolyzer 6 Nm³/h
- Electric storage: 150 kWh
- Hydrogen storage: 30 kWh
- Thermal storage: 50 kWh
- Electric Vehicles (EV): 2
- Electric Bikes: 10

Case study microgrid configuration

Power System (PV + BESS) connected to the National Electricity Grid through a single connection point

Microgrid components

PV fields

- ❑ PV1: 27kW_{nom}
- ❑ PV2: 26kW_{nom}
- ❑ PV3: 25kW_{nom}

Batteries

- ❑ BESS : $70\text{kW}_{\text{peak}}$, size 70kWh
- ❑ HyESS: $70\text{kW}_{\text{peak}}$, size 70kWh

EV load

- ❑ Data from JPL database

Grid

- ❑ Maximum purchase electricity 40kW

	Module	Technique	Version	Reference
FORECASTER	PV Forecaster	PHANN	v1.0	[1]
	EV Forecaster	LSTM+ persistence	v2.1 v1.0	[2]
OPTIMIZER	1° Layer	Deterministic MILP	v1.0	[3]
	2° Layer	Heuristic Control	v1.2	[4]

Generation and Consumption Balance
From 2023-10-13 0:00 to 2023-10-19 23:45

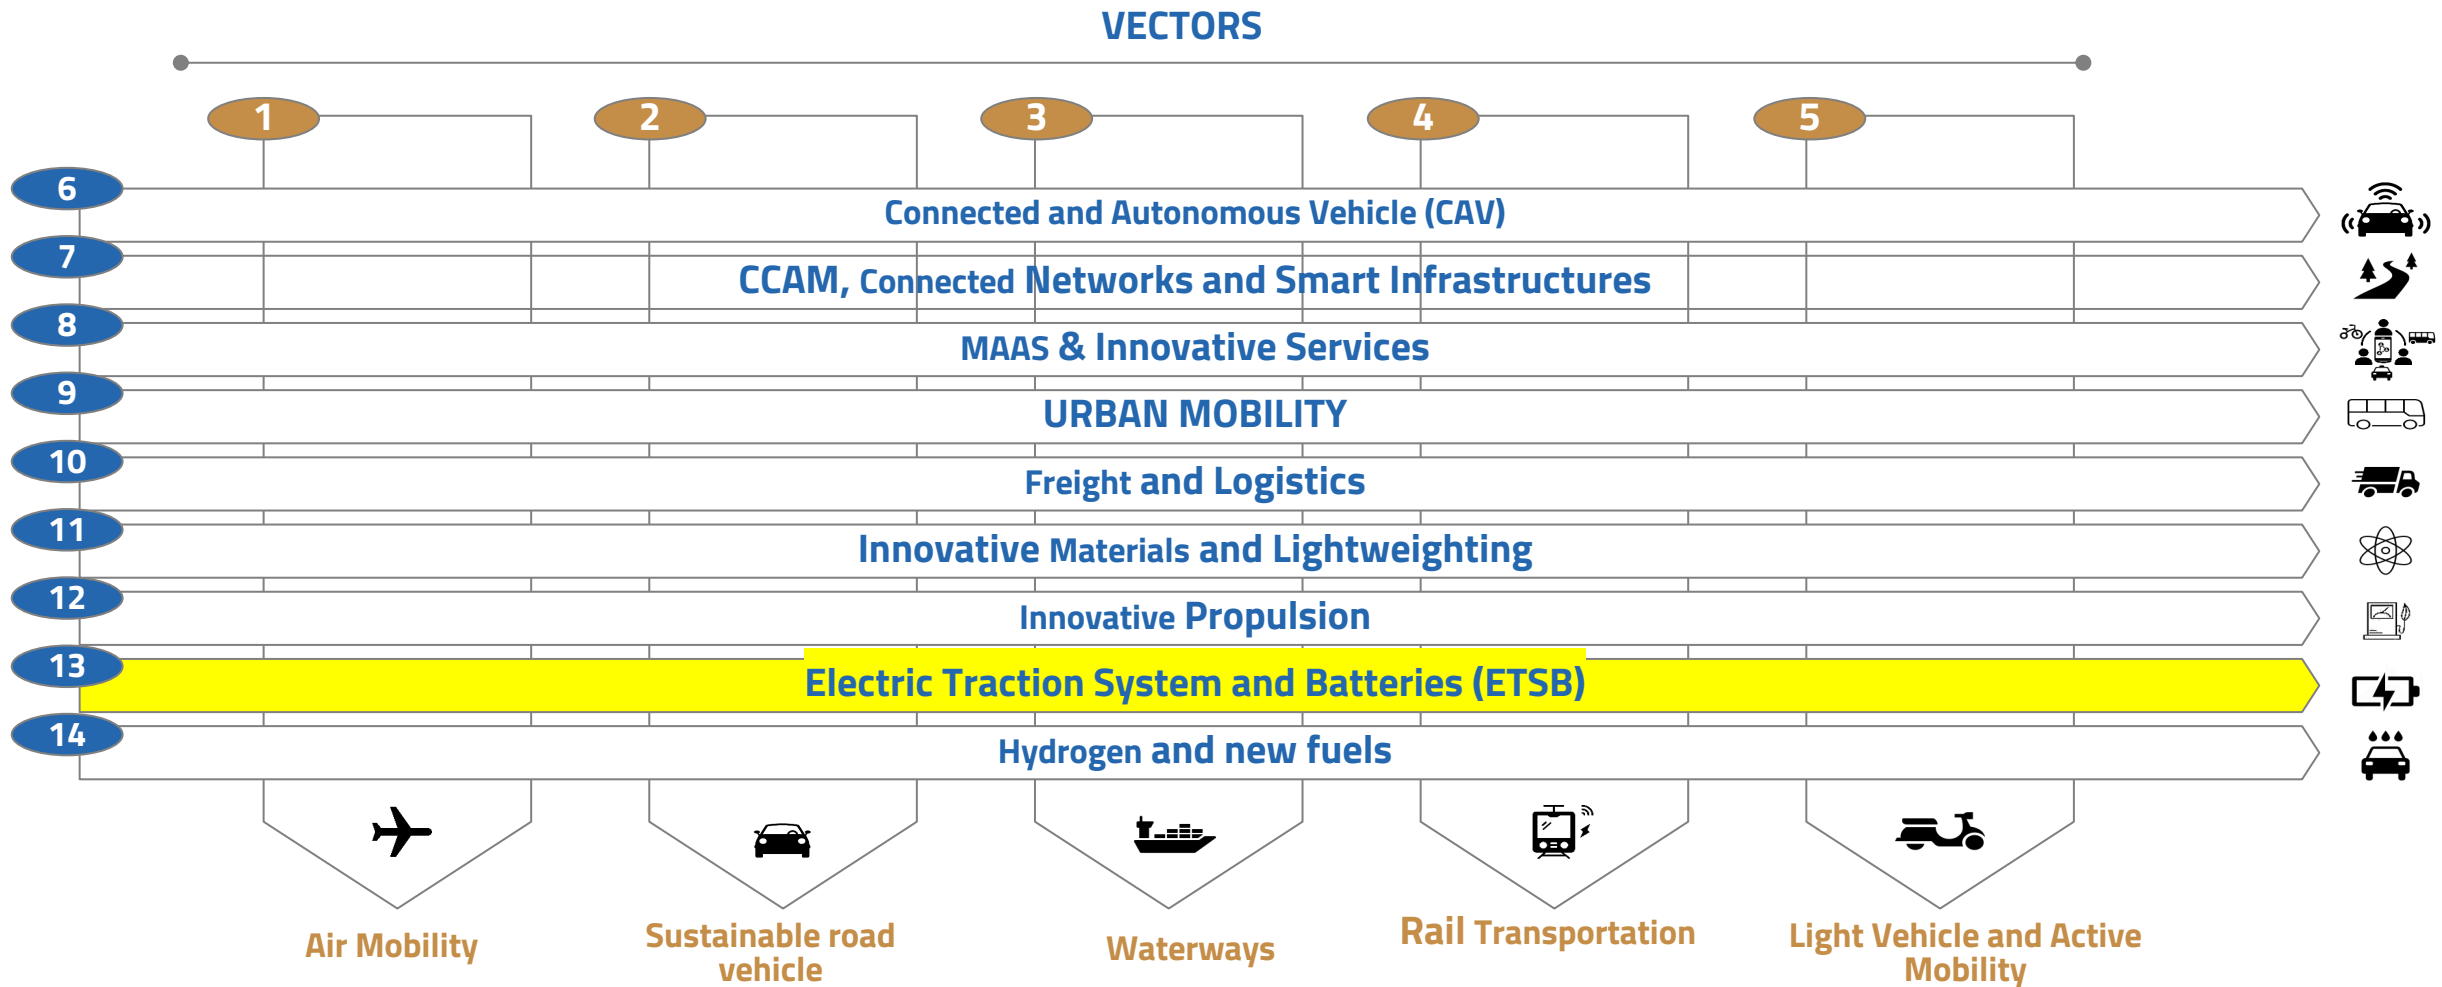

Highlights

- The experimental campaign has been performed **without** any malfunctioning
- **PV Forecaster's** performances are good and quite consistent over the entire week of experiments
- Three **EV Forecaster based** on the LSTM+ tested: a persistence model (with seasonality = 7days), an LSTM+ model ran every 24 hours, an LSTM+ model ran every hour
- The LSTM+ model ran every hour shows the best performance in predicting the peaks and the changes in the load in both workdays and during the weekends. During this week also persistence models show acceptable performances only during workdays, when the load profile is more predictable
- The EMS rightly exploits PV and EV forecasts to anticipates the change in the load and minimizes the overall operational costs
